(Received 20 November 2024, Revised 19 February 2025, Accepted 28 February 2025)

**Abstract.** The study of Gorenstein projective and injective modules has been a cornerstone in the field of Gorenstein homological algebra since these concepts were first introduced. This paper marks a significant advancement in the field by demonstrating the integration of  $\phi$ -torsion theory into Gorenstein homological algebra. We take this exploration further by introducing and examining the novel concepts of nonnil-Gorenstein projective and injective modules. Our study also extends to the nonnil-Gorenstein projective and injective dimensions of a module, offering a deeper insight into their structure and implications. Furthermore, we delve into the concept of nonnil-Gorenstein global dimension of a ring, unveiling its significance and potential applications. A key application of these innovative concepts is their use in characterizing  $\phi$  von Neumann regular rings. This approach not only adds a new dimension to our understanding of these rings but also highlights the versatility and depth of Gorenstein homological algebra.

**Key Words:**  $\phi$ -torsion theory,  $\phi$ -(weak) global dimension of rings, nonnil-Gorenstein global dimension of rings.

**2020 MSC:** 13A15, 13A18, 13F05, 13G05, 13C20.

Dedicated to our Professor David E. Dobbs for his 80<sup>th</sup> Birthday.

## 1 Introduction

We devote this introductory section to some conventions and a review of some standard background material. All rings considered in this paper are assumed to be commutative with non-zero identity and prime nilradical. We use  $\text{Nil}(R)$  to denote the set of nilpotent elements of  $R$ , and  $Z(R)$  to denote the set of zero-divisors of  $R$ . A ring with  $\overline{\text{Nil}}(R)$  being divided prime (i.e.,  $\text{Nil}(R) \subset xR$ , for every  $x \in R \setminus \text{Nil}(R)$ ) is called a  $\phi$ -ring. Let  $\mathcal{H}$  (resp.,  $\overline{\mathcal{H}}$ ) be the set of all rings with divided prime nilradical (resp., divided prime nilradical but not maximal). A ring  $R$  is called a strongly  $\phi$ -ring if  $R \in \mathcal{H}$  and  $Z(R) = \text{Nil}(R)$ .

Let  $R$  be a ring and  $M$  be an  $R$ -module. We define

$$\phi\text{-tor}(M) = \{x \in M \mid sx = 0 \text{ for some } s \in R \setminus \text{Nil}(R)\}.$$

If  $\phi\text{-tor}(M) = M$ , then  $M$  is called a  $\phi$ -torsion module, and if  $\phi\text{-tor}(M) = 0$ , then  $M$  is called a  $\phi$ -torsion-free module. An  $R$ -module  $M$  is said to be  $\phi$ -uniformly torsion ( $\phi$ -u-torsion for short) if  $sM = 0$  for some  $s \in R \setminus \text{Nil}(R)$ . An ideal  $I$  of  $R$  is called nonnil if  $I \not\subseteq \text{Nil}(R)$ . A ring  $R$  is said to be self-injective if it is an injective module over itself; if, in addition,  $R$  is Noetherian, then  $R$  is said to be a quasi-Frobenius ring. As usual, we use  $\text{pd}_R(M)$ ,  $\text{id}_R(M)$ , and  $\text{fd}_R(M)$  to denote the classical

projective, injective, and flat dimension of  $M$ , respectively. For a Noetherian ring  $R$ , Auslander and Bridger [3] introduced the  $G$ -dimension,  $\text{Gdim}_R(M)$ , for every finitely generated  $R$ -module  $M$ . They showed that  $\text{Gdim}_R(M) \leq \text{pd}_R(M)$  for every finitely generated  $R$ -module  $M$ , and equality holds if  $\text{pd}_R(M)$  is finite. Several decades later, Enochs and Jenda [15, 16] introduced the notion of the Gorenstein projective dimension ( $G$ -projective dimension for short) as an extension of  $G$ -dimension to modules that are not necessarily finitely generated, and the Gorenstein injective dimension ( $G$ -injective dimension for short) as a dual notion of the Gorenstein projective dimension. To complete the analogy with the classical homological dimension, Enochs et al. [18] introduced the Gorenstein flat dimension. Some related references are [7, 12, 13, 15, 16, 18, 21, 22]. Recall from [15] that an  $R$ -module  $M$  is said to be Gorenstein projective ( $G$ -projective for short) if there exists an exact sequence of projective  $R$ -modules

$$\mathbf{P}: \dots \longrightarrow P_1 \longrightarrow P_0 \longrightarrow P^0 \longrightarrow P^1 \longrightarrow \dots$$

such that  $M \cong \text{Im}(P_0 \rightarrow P^0)$  and such that the functor  $\text{Hom}_R(-, Q)$  leaves  $\mathbf{P}$  exact whenever  $Q$  is projective. The complex  $\mathbf{P}$  is called a complete projective resolution. It is known that  $M$  is  $G$ -projective if and only if  $M$  has a complete projective resolution  $\mathbf{P}$  such that  $\text{Ext}_R^1(L, Q) = 0$  for any syzygy  $L$  of  $\mathbf{P}$  and any module  $Q$  with finite projective dimension. The Gorenstein injective ( $G$ -injective for short) modules are defined dully.

On the other hand, in [32], Tang, Wang and Zhao introduced the class of  $\phi$ -rings, called  $\phi$ -von Neumann regular rings. An  $R$ -module  $M$  is said to be  $\phi$ -flat if for every  $R$ -monomorphism  $f : A \rightarrow B$  with  $\text{Coker}(f)$   $\phi$ -torsion,  $f \otimes 1 : A \otimes_R M \rightarrow B \otimes_R M$  is an  $R$ -monomorphism [32, Definition 3.1]. An  $R$ -module  $M$  is  $\phi$ -flat if and only if  $M_{\mathfrak{p}}$  is  $\phi$ -flat for every prime ideal  $\mathfrak{p}$  of  $R$ , if and only if  $M_{\mathfrak{m}}$  is  $\phi$ -flat for every maximal ideal  $\mathfrak{m}$  of  $R$  [32, Theorem 3.5]. A  $\phi$ -ring  $R$  is called a  $\phi$ -von Neumann regular ring if all  $R$ -modules are  $\phi$ -flat. This is equivalent to stating that  $R/\text{Nil}(R)$  is a von Neumann regular ring [32, Theorem 4.1].

The authors of [14] introduced and defined the  $\phi$ -(weak) global dimension of rings with prime nilradical. An  $R$ -module  $P$  is said to be  $\phi$ -u-projective if  $\text{Ext}_R^1(P, N) = 0$  for each  $\phi$ -u-torsion  $R$ -module  $N$  [14, Definition 3.1]. The  $\phi$ -projective dimension of  $M$  over  $R$ , denoted by  $\phi\text{-pd}_R M$ , is defined to be at most  $n$  (where  $n \geq 1$  and  $n \in \mathbb{N}$ ) if either  $M = 0$ , or  $M \neq 0$  and  $M$  is not  $\phi$ -u-projective, and if it satisfies the condition  $\text{Ext}_R^{n+1}(M, N) = 0$  for any  $\phi$ -u-torsion module  $N$ . If  $n$  is the least non-negative integer for which  $\text{Ext}_R^{n+1}(M, N) = 0$  for every  $\phi$ -u-torsion module  $N$ , then we set  $\phi\text{-pd}_R M = n$ . If there is no such  $n$ , we set  $\phi\text{-pd}_R M = \infty$ . An  $R$ -module  $E$  is said to be nonnil injective if  $\text{Ext}_R^1(R/I, E) = 0$  for all nonnil ideals of  $R$ . The  $\phi$ -injective dimension of  $M$  over  $R$ , denoted by  $\phi\text{-id}_R M$ , is defined to be at most  $n$  (where  $n \geq 1$  and  $n \in \mathbb{N}$ ) if either  $M = 0$ , or  $M \neq 0$  and  $M$  is not nonnil injective, and if it satisfies the condition  $\text{Ext}_R^{n+1}(R/I, M) = 0$  for any nonnil ideal  $I$  of  $R$ . If  $n$  is the least non-negative integer for which  $\text{Ext}_R^{n+1}(R/I, M) = 0$  for every nonnil ideal  $I$  of  $R$ , then we set  $\phi\text{-id}_R M = n$ . If there is no such  $n$ , we set  $\phi\text{-id}_R M = \infty$ , and we easily have that an  $R$ -module  $M$  of  $\phi$ -injective dimension 0 if and only if it is nonnil injective. For a ring  $R$ , its  $\phi$ -global dimension is either 0 or the supremum of all  $\phi\text{-pd}_R(R/I)$ , where  $I$  is a nonnil ideal of  $R$  such that  $R/I$  is not  $\phi$ -u-projective. In particular, for a ring  $R$  of  $Z(R) = \text{Nil}(R)$ , its  $\phi$ -global dimension is the supremum of  $\phi\text{-pd}_R(R/I)$  for all nonnil ideals  $I$  of  $R$ .

In [2], Anderson and Badawi introduced the class of  $\phi$ -rings called  $\phi$ -Dedekind rings. A  $\phi$ -ring  $R$  is said to be  $\phi$ -Dedekind if  $R/\text{Nil}(R)$  is a Dedekind domain.

This paper is divided into four sections, including the introduction. In Section 2, we define nonnil-Gorenstein projective modules, nonnil-Gorenstein injective modules and nonnil-Gorenstein flat. We then present some characterizations of these modules and establish that every nonnil-Gorenstein projective (resp., nonnil-Gorenstein injective) module is Gorenstein projective (resp., Gorenstein injective). We also provide examples of Gorenstein projective (resp., Gorenstein injective) modules that are not nonnil-Gorenstein projective (resp., nonnil-Gorenstein injective). The section concludes by establishing analogs of the well-known behavior, as demonstrated in [21, 2.5. Theorem], showing

more precisely that nonnil-Gorenstein projective (resp., nonnil-Gorenstein injective)  $R$ -modules are projectively (respectively, injectively) resolving.

In Section 3, we introduce analogs of Gorenstein projective and Gorenstein injective dimensions, termed nonnil-Gorenstein projective and injective dimensions.

The final section briefly defines the nonnil-Gorenstein global dimension of a ring  $R$  as the supremum of all  $\phi\text{-Gpd}_R M$ , where  $M$  is an  $R$ -module. We note that  $G\text{-gl. dim}(R) \leq \phi\text{-G. gl. dim}(R)$  for all rings  $R$ . We characterize rings of nonnil-Gorenstein global dimension 0 as those in which every nonnil-injective module is projective, equivalent to every  $\phi$ -u-projective module being nonnil-injective. We also show that  $\phi$ -rings of nonnil-Gorenstein global dimension 0 are fields. In the second part of this section, we introduce the closed nonnil-Gorenstein global dimension of rings as the supremum of all nonnil-Gorenstein projective dimensions of  $\phi$ -u-torsion modules. We establish that  $\phi$ -von Neumann regular rings are strongly  $\phi$ -rings of closed nonnil-Gorenstein global dimension 0, equivalent to von Neumann regular rings being strongly  $\phi$ -rings where every  $\phi$ -u-projective module is nonnil-injective.

To provide examples, we discuss the trivial extension. Let  $R$  be a ring and  $E$  be an  $R$ -module. The trivial ring extension of  $R$  by  $E$ , denoted  $R \rtimes E$ , has the additive structure of the external direct sum  $R \oplus E$  and multiplication defined by  $(a, e)(b, f) := (ab, af + be)$  for all  $a, b \in R$  and  $e, f \in E$ . This construction is also known by other terminology and notations, such as the idealization  $R(+E)$  (see [6, 19, 23, 24]).

For any undefined terminology and notation, readers are referred to [12, 17, 19, 23, 33].

## 2 On nonnil-Gorenstein projective, injective and flat modules

We start this section by defining two new classes of modules, which we call nonnil-Gorenstein projective and nonnil-Gorenstein injective. These two classes are sub-classes of Gorenstein projective and Gorenstein injective, respectively.

**Definition 2.1.** An  $R$ -module  $M$  is said to be nonnil-Gorenstein projective (nonnil-G-projective for short) if there exists a complete projective resolution of  $M$ , that is an exact sequence of  $R$ -modules

$$\mathcal{P}: \quad \cdots \longrightarrow P_1 \longrightarrow P_0 \longrightarrow P^0 \longrightarrow P^1 \longrightarrow \cdots$$

in which all  $P_i, P^j$  are projective modules and  $M \cong \text{Im}(P_0 \rightarrow P^0)$  and such that the functor  $\text{Hom}_R(-, Q)$  leaves  $\mathcal{P}$  exact whenever  $Q$  is a  $\phi$ -u-projective module.

The nonnil-Gorenstein injective (nonnil-G-injective for short) modules are defined dually as follows: An  $R$ -module  $N$  is said to be nonnil-G-injective if there exists a complete injective resolution of  $N$ , that is

$$\mathcal{E}: \quad \cdots \longrightarrow E^1 \longrightarrow E^0 \longrightarrow E_0 \longrightarrow E_1 \longrightarrow \cdots$$

such that all  $E_i, E^j$  are injective modules and such that both  $N \cong \text{Im}(E^0 \rightarrow E_0)$  and  $\text{Hom}(Q, \mathcal{E})$  is a complex exact of  $R$ -modules for every nonnil-injective module  $Q$ .

**Remark 2.2.** 1. It is easy to see from [17, Definition 10.2.1] that every nonnil-G-projective module is Gorenstein projective, and so the projective dimension of every nonnil-G-projective module is either zero or infinite by [17, Proposition 10.2.3]. Dually the nonnil-G-injective modules are Gorenstein injective by [17, Definition 10.1.1]. Thus, the injective dimension of any nonnil-G-injective module is either zero or infinite.

2. Every projective module  $P$  is nonnil-Gorenstein projective. In fact, the exact sequence  $0 \rightarrow P \rightarrow P \rightarrow 0$  is a complete projective resolution of  $P$ , and for every  $\phi$ -u-projective module  $M$ , we have the isomorphism of  $R$ -modules  $0 \rightarrow \text{Hom}_R(P, M) \rightarrow \text{Hom}_R(P, M) \rightarrow 0$ . In the same way, we establish that every injective module is nonnil-G-injective.

3. Note that a  $\phi$ -u-projective module is not necessarily a nonnil-G-projective module. For instance, consider  $R := K \rtimes K^n$ , where  $n \geq 2$  and  $K$  is a field. In this case, its Gorenstein global dimension is infinite, as shown in [27, Corollary 3.8]. Consequently, there exists no Gorenstein projective  $R$ -module  $M$ ; in particular,  $M$  is not nonnil-G-projective by (1). However,  $R$  is a  $\phi$ -von Neumann regular ring by [14, Theorem 5.16], which implies that  $M$  is  $\phi$ -u-projective by [14, Corollary 5.34]. Similarly, we establish that there are nonnil-injective  $R$ -modules that are not nonnil-Gorenstein injective.

Next, we may write a complete projective resolution of an  $R$ -module  $M$  as follows:

$$\mathcal{P} : \quad \cdots \longrightarrow P_1 \longrightarrow P_0 \longrightarrow P_{-1} \longrightarrow P_{-2} \longrightarrow \cdots . \tag{1}$$

Note that  $M \cong \text{Im}(P_0 \rightarrow P_{-1})$ . Set  $K_i := \text{Ker}(P_i \rightarrow P_{i-1})$  for the  $i$ -th syzygy of (1); in particular,  $M \cong K_{-1}$ .

In the same way, we may write a complete injective resolution of an  $R$ -module  $N$  as follows:

$$\mathcal{E} : \quad \cdots \longrightarrow E_{-1} \longrightarrow E_0 \longrightarrow E_1 \longrightarrow E_2 \longrightarrow \cdots . \tag{2}$$

The  $i$ -th cosyzygy  $K_i$  of (2) is defined as  $K_i := \text{Im}(E_i \rightarrow E_{i+1})$ ; in particular,  $N \cong K_{-1}$ . Our first characterization of the nonnil-G-projective modules is as follows.

**Theorem 2.3.** The following are equivalent for an  $R$ -module  $M$ :

1.  $M$  is nonnil-Gorenstein projective,
2.  $M$  has a complete projective resolution (1) such that  $\text{Ext}_R^1(K_i, Q) = 0$  for every  $\phi$ -u-projective module  $Q$  and every  $i$ -th syzygy  $K_i$  of (1),
3.  $M$  has a complete projective resolution (1) such that  $\text{Ext}_R^k(K_i, Q) = 0$  for every  $\phi$ -u-projective module  $Q$  and every  $i$ -th syzygy  $K_i$  of (1) and every  $k \geq 1$ ,
4.  $M$  has a complete projective resolution (1) such that  $\text{Ext}_R^k(K_i, Q) = 0$  for every  $R$ -module  $Q$  of finite  $\phi$ -projective dimension and every  $i$ -th syzygy  $K_i$  of (1) and every  $k \geq 1$ ,
5.  $M$  has a complete projective resolution (1) such that  $\text{Ext}_R^1(K_i, Q) = 0$  for every  $R$ -module  $Q$  of finite  $\phi$ -projective dimension and every  $i$ -th syzygy  $K_i$  of (1),
6.  $M$  has a right projective resolution (i.e.,  $\mathcal{R} : 0 \rightarrow M \rightarrow P_{-1} \rightarrow P_{-2} \rightarrow \cdots$ , where each  $P_i$  is projective) such that for every  $\phi$ -u-projective module  $Q$ , both the complex  $\text{Hom}(\mathcal{R}, Q)$  is exact and  $\text{Ext}_R^k(M, Q) = 0$  for every  $k > 0$ .

*Proof.* (4)  $\Rightarrow$  (6) & (4)  $\Rightarrow$  (5)  $\Rightarrow$  (1) They are obvious.

(1)  $\Rightarrow$  (2) Assume that  $M$  is a  $\phi$ -Gorenstein projective module and let  $i \in \mathbb{Z}$  and  $Q$  be a  $\phi$ -u-projective module. Then there exists a complete projective resolution of  $M$  as (1). Starting by the exact sequence  $P_{i+2} \rightarrow P_{i+1} \rightarrow K_i \rightarrow 0$ , we get the exact sequence  $0 \rightarrow \text{Hom}_R(K_i, Q) \rightarrow \text{Hom}_R(P_{i+1}, Q) \xrightarrow{d} \text{Hom}_R(P_{i+2}, Q)$ , this shows that  $\ker(d) = \text{Hom}_R(K_i, Q)$ . Now, considering the exact sequence  $0 \rightarrow K_i \rightarrow P_i \rightarrow K_{i-1} \rightarrow 0$ , we get the exact sequence  $0 \rightarrow \text{Hom}_R(K_{i-1}, Q) \rightarrow \text{Hom}_R(P_i, Q) \xrightarrow{d} \text{Hom}_R(K_i, Q) \rightarrow \text{Ext}_R^1(K_{i-1}, Q) \rightarrow 0$ . Since  $\ker(d) = \text{Im}(d) = \text{Hom}_R(K_i, Q)$ , we get immediately  $\text{Ext}_R^1(K_{i-1}, Q) = 0$ . Since  $i \in \mathbb{Z}$ , we get (2), as desired.

(2)  $\Rightarrow$  (1) If (2) holds, then by considering the short exact sequences  $0 \rightarrow K \rightarrow P_i \rightarrow K \rightarrow 0$  for every  $i \in \mathbb{Z}$ , so we have  $0 \rightarrow \text{Hom}_R(K, Q) \rightarrow \text{Hom}_R(P_i, Q) \rightarrow \text{Hom}_R(K, Q) \rightarrow 0$  is exact for any  $\phi$ -u-projective module  $Q$ . By linking these short exact sequences, we get a long exact sequence  $\cdots \rightarrow \text{Hom}_R(P_{i+1}, Q) \rightarrow \text{Hom}_R(P_i, Q) \rightarrow \text{Hom}_R(P_{i-1}, Q) \rightarrow \cdots$ , as desired  $M$  is  $\phi$ -Gorenstein projective.

(2)  $\Rightarrow$  (3) It follows from the short exact sequences  $0 \rightarrow K \rightarrow P_i \rightarrow K \rightarrow 0$  that  $\text{Ext}_R^{k+1}(K, Q) \cong \text{Ext}_R^k(K, Q)$  where  $K$  is the syzygies of the complete projective resolution. Now the assertion follows by induction on  $k$ .

(3)  $\Rightarrow$  (4) Let  $n = \phi\text{-pd}_R Q$ . If  $n = 0$ , then  $Q$  is  $\phi$ -u-projective and so (4) holds by hypothesis. Now, assume that  $n \neq 0$ , i.e.,  $Q$  is not  $\phi$ -u-projective. Following [14, Theorem 3.10], there exists an exact sequence  $0 \rightarrow Q_n \rightarrow Q_{n-1} \rightarrow \cdots \rightarrow Q_0 \rightarrow Q \rightarrow 0$  such that  $Q_i$  is projective for all  $0 \leq i \leq n-1$  and  $Q_n$  is  $\phi$ -u-projective. But considering these short exact sequences  $0 \rightarrow Q_n \rightarrow Q_{n-1} \rightarrow K \rightarrow 0, \dots, 0 \rightarrow K \rightarrow Q_0 \rightarrow Q \rightarrow 0$  where  $K$  is the syzygies of the above exact sequence, so we get for all  $k \in \mathbb{N}^*$ ,  $0 = \text{Ext}_R^k(K, Q_{n-1}) \rightarrow \text{Ext}_R^k(K, K) \rightarrow \text{Ext}_R^{k+1}(K, Q_n) = 0$ . So  $\text{Ext}_R^k(K, K) = 0$  for every  $K$ , in particular  $\text{Ext}_R^k(K, Q) = 0$ , as desired.

(6)  $\Rightarrow$  (1) Let  $\mathcal{P}r : \cdots \rightarrow P_1 \rightarrow P_0 \rightarrow M \rightarrow 0$  be a projective resolution of  $M$ . Since  $\text{Ext}_R^k(M, Q) = 0$  for every  $\phi$ -u-projective module  $Q$  and every  $k \geq 1$ , we get  $\text{Hom}(\mathcal{P}r, Q)$  is an exact complex. Set  $\mathcal{P}r \cup \mathcal{R}$  is the linking between  $\mathcal{P}r$  and  $\mathcal{R}$  through  $M$ , we get a complete projective resolution of  $M$  such that  $\text{Hom}(\mathcal{P}r \cup \mathcal{R}, Q)$  is an exact complex for every  $\phi$ -u-projective module  $Q$ , as desired  $M$  is  $\phi$ -Gorenstein projective.  $\square$

Dually with Theorem 2.3, the nonnil-G-injective modules are characterized as follows.

**Theorem 2.4.** The following are equivalent for an  $R$ -module  $N$ :

1.  $N$  is nonnil-G-injective,
2.  $N$  has a complete injective resolution (2) such that  $\text{Ext}_R^1(Q, K_i) = 0$  for every nonnil-injective module  $Q$  and every  $i$ -th cosyzygy  $K_i$  of (2),
3.  $N$  has a complete injective resolution (2) such that  $\text{Ext}_R^k(Q, K_i) = 0$  for every nonnil-injective module  $Q$  and every  $i$ -th cosyzygy  $K_i$  of (2) and every  $k \geq 1$ ,
4.  $N$  has a complete injective resolution (2) such that  $\text{Ext}_R^k(Q, K_i) = 0$  for every  $R$ -module  $Q$  of finite  $\phi$ -injective dimension, every  $i$ -th cosyzygy  $K_i$  of (2) and every  $k \geq 1$ ,
5.  $N$  has a complete injective resolution (2) such that  $\text{Ext}_R^1(Q, K_i) = 0$  for every  $R$ -module  $Q$  of finite  $\phi$ -injective dimension and every  $i$ -th cosyzygy  $K_i$  of (2),
6.  $N$  has a left injective resolution (i.e.,  $\mathcal{L} : \cdots \rightarrow E_1 \rightarrow E_0 \rightarrow N \rightarrow 0$ ) such that for every nonnil-injective module  $Q$ , we get the exact complex  $\text{Hom}(Q, \mathcal{L})$  and  $\text{Ext}_R^k(Q, N) = 0$  for every  $k > 0$ .

*Proof.* This proof is analogous to that of Theorem 2.3 above.  $\square$

**Remark 2.5.** 1. If  $M$  is nonnil-G-projective with its complete projective resolution  $\mathcal{P}$ , then by symmetry all images and hence all kernels and cokernels of  $\mathcal{P}$  are nonnil-G-projective modules.

2. If  $N$  is nonnil-G-injective with its complete projective resolution  $\mathcal{E}$ , then by symmetry all images and hence all kernels and cokernels of  $\mathcal{E}$  are nonnil-G-injective modules.

From Theorem 2.3 we can easily deduce the following.

**Corollary 2.6.** 1. If  $M$  is a nonnil-G-projective module, then  $\text{Ext}_R^k(M, Q) = 0$  for every  $k \geq 1$  and every  $R$ -module  $Q$  of finite  $\phi$ -projective dimension.

2. If  $N$  is a nonnil-G-injective module, then  $\text{Ext}_R^k(Q, N) = 0$  for every  $k \geq 1$  and every  $R$ -module  $Q$  of finite  $\phi$ -injective dimension.

Recall from [32] that a  $\phi$ -ring  $R$  is said to be  $\phi$ -von Neumann regular if every  $R$ -module is  $\phi$ -flat. It is shown in [14, Corollary 5.34] that every  $\phi$ -von Neumann regular is characterized by the fact that every module over it is  $\phi$ -u-projective and nonnil-injective, i.e., every module over a  $\phi$ -von Neumann regular ring has both finite  $\phi$ -projective and  $\phi$ -injective dimension.

**Corollary 2.7.** Let  $R$  be a ring in which every  $R$ -module has finite  $\phi$ -projective dimension and  $M$  be an  $R$ -module. Then  $M$  is nonnil-G-projective if and only if  $M$  is projective.

**Corollary 2.8.** *Let  $R$  be a ring in which every  $R$ -module has finite  $\phi$ -injective dimension and  $M$  be an  $R$ -module. Then  $N$  is nonnil- $G$ -injective if and only if  $N$  is injective.*

*Proof.* This is easily done by Theorem 2.4. □

**Remark 2.9.** We now justify that the class of Gorenstein projective modules generalizes the class of nonnil- $G$ -projective modules. In other words, the class of nonnil- $G$ -projective modules is strictly contained in the class of Gorenstein projective modules. Let  $R = K \rtimes K$ , where  $K$  is a field. We claim that there exists a Gorenstein projective  $R$ -module which is not nonnil- $G$ -projective. However,  $R$  is a  $\phi$ -von Neumann regular ring. Thus, if every Gorenstein projective  $R$ -module is nonnil- $G$ -projective, then  $R$  is a semisimple ring by Corollary 2.7 and [27, Corollary 3.8], a desired contradiction since  $\text{Nil}(R) \neq 0$ . Therefore,  $R$  contains a Gorenstein projective module which is not nonnil- $G$ -projective. Similarly, we can justify that there exists a Gorenstein injective  $R$ -module which is not nonnil- $G$ -injective.

**Example 2.10.** Let  $R = \mathbb{Z} \rtimes \mathbb{Q}$ . Then every nonnil- $G$ -injective  $R$ -module is injective. In fact,  $R$  is a strongly  $\phi$ -ring and  $\phi\text{-gl.dim}(R) = 1$  by [14, Example 6.5]. Therefore, every  $R$ -module has finite  $\phi$ -injective dimension, a conclusion supported by the fact that every nonnil ideal of  $R$  is free (see [14, Theorem 4.1]).

The  $\phi$ -von Neumann regular rings are characterized according to the nonnil-Gorenstein projectivity or nonnil-Gorenstein injectivity as follows.

**Theorem 2.11.** The following are equivalent for a  $\phi$ -ring  $R$ :

1.  $R$  is a  $\phi$ -von Neumann regular ring,
2.  $R$  is a strongly  $\phi$ -ring such that every  $R$ -module has finite  $\phi$ -projective dimension and every  $\phi$ -torsion module is nonnil- $G$ -projective,
3.  $R$  is a strongly  $\phi$ -ring such that every  $R$ -module has finite  $\phi$ -projective dimension and every  $\phi$ -u-torsion module is nonnil- $G$ -projective,
4.  $R$  is a strongly  $\phi$ -ring such that every  $R$ -module has finite  $\phi$ -injective dimension and every  $\phi$ -torsion module is nonnil- $G$ -injective,
5.  $R$  is a strongly  $\phi$ -ring such that every  $R$ -module has finite  $\phi$ -injective dimension and every  $\phi$ -u-torsion module is nonnil- $G$ -injective.

*Proof.* (2)  $\Rightarrow$  (3) & (4)  $\Rightarrow$  (5) These are straightforward.

(1)  $\Rightarrow$  (2) & (1)  $\Rightarrow$  (4) These follow directly from [14, Corollary 5.15, Theorem 5.29 and Corollary 5.33] and the fact that every  $\phi$ -torsion  $R$ -module is zero.

(3)  $\Rightarrow$  (1) Let  $I$  be a nonnil ideal of  $R$ . Then  $R/I$  is a  $\phi$ -u-torsion  $R$ -module, and so  $R/I$  is nonnil- $G$ -projective. By Corollary 2.7, we get that  $R/I$  is projective, and so  $I$  is generated by an idempotent. From [32, Theorem 4.1], we deduce that  $R$  is a  $\phi$ -von Neumann regular ring.

(5)  $\Rightarrow$  (1) Let  $s \in R \setminus \text{Nil}(R)$ . Then  $R/sR$  is a  $\phi$ -u-torsion  $R$ -module, and so  $R/sR$  is nonnil- $G$ -injective. Thus  $R/sR$  is an injective  $R$ -module by Corollary 2.8. So we get  $R = sR$ , and so  $s \in U(R)$ . Therefore,  $R$  is a  $\phi$ -von Neumann regular ring by [14, Theorem 5.14]. □

**Proposition 2.12.** *Every direct sums (resp., direct product) of nonnil- $G$ -projective (resp., nonnil- $G$ -injective) modules is nonnil- $G$ -projective (resp., nonnil- $G$ -injective).*

*Proof.* Let  $\{M_i\}_{i \in I}$  be a family of nonnil-G-projective modules and  $\mathcal{P}_i$  be a complete projective resolution of  $M_i$  for each  $i \in I$ . Then  $\bigoplus_{i \in I} \mathcal{P}_i$  is a complete projective resolution of  $\bigoplus_{i \in I} M_i$ . By [33, Theorem 2.1.19], we get easily that  $\bigoplus_{i \in I} M_i$  is nonnil-G-projective. Dually, we can establish the "nonnil-G-injective" case.  $\square$

Next, we establish an analog of the well-known result [21, 2.5. Theorem]. More precisely, the following theorem shows that the nonnil-G-projective (resp., injective)  $R$ -modules are projectively (resp., injectively) resolving.

**Theorem 2.13.** Let  $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$  be a short exact sequence.

1. If  $C$  is a nonnil-G-projective module, then  $A$  is nonnil-G-projective if and only if  $B$  is nonnil-G-projective.
2. If  $A$  is a nonnil-G-injective module, then  $B$  is nonnil-G-injective if and only if  $C$  is nonnil-G-injective.

*Proof.* (1) This follows immediately from [10, Theorem 2.3 (1)].

(2) This follows immediately from [30, 2.10. Proposition].  $\square$

**Proposition 2.14.** (1) Every  $R$ -module is nonnil-Gorenstein projective if and only if every  $\phi$ - $u$ -projective  $R$ -module is injective.

(2) Every  $R$ -module is nonnil-Gorenstein injective if and only if every nonnil-injective  $R$ -module is projective. In particular, when the above equivalent conditions are satisfied  $R$  is quasi-Frobenius.

*Proof.* (1) This follows immediately from [10, Proposition 2.4] by setting  $\mathcal{X}$  to be the set of all  $\phi$ - $u$ -projective  $R$ -modules.

(2) This follows immediately from [30, 2.9. Proposition] by setting  $\mathcal{Y}$  to be the set of all nonnil-injective  $R$ -modules.  $\square$

Next, we will define the nonnil-Gorenstein flat  $R$ -modules as follows.

**Definition 2.15.** Let  $R$  be a ring and  $M$  be an  $R$ -module. We say that  $M$  is nonnil-Gorenstein flat if there exists a complete flat resolution of  $M$ , which is an exact sequence of  $R$ -modules of the form

$$\mathcal{F} : \cdots \rightarrow F_n \rightarrow F_{n-1} \rightarrow \cdots \rightarrow F_1 \rightarrow F_0 \rightarrow F^0 \rightarrow F^1 \rightarrow \cdots \rightarrow F^n \rightarrow \cdots$$

where each  $F_i$  is a flat  $R$ -module, and such that the complex  $E \otimes_R \mathcal{F}$  is exact for every nonnil-injective  $R$ -module  $E$ . Furthermore,  $M$  is isomorphic to  $\text{im}(F_0 \rightarrow F^0)$ .

**Remark 2.16.** It is easy to see that every nonnil-Gorenstein flat  $R$ -module is a Gorenstein-flat.

**Proposition 2.17.** The class of nonnil-Gorenstein flat  $R$ -modules is closed under arbitrary direct sums.

*Proof.* Simply note that a (degreewise) sum of complete flat resolutions again is a complete flat resolution (as tensorproducts commutes with sums).  $\square$

**Theorem 2.18.** For any left  $R$ -module  $M$ , we consider the following conditions:

1.  $M$  is a nonnil-Gorenstein flat  $R$ -module,
2. The Pontryagin dual  $M^+ = \text{Hom}_{\mathbb{Z}}(M, \mathbb{Q}/\mathbb{Z})$  is a nonnil-Gorenstein injective  $R$ -module,

3.  $M$  admits a co-proper right flat resolution

$$\mathcal{F}_r : 0 \rightarrow M \rightarrow F^0 \rightarrow F^1 \rightarrow F^2 \rightarrow \dots.$$

such that  $E \otimes_R \mathcal{F}_r$  is an exact complex of  $R$ -modules and  $\text{Tor}_i^R(E, M) = 0$  for all nonnil-injective  $R$ -modules  $E$ , and all integers  $i > 0$ .

Then (1)  $\Rightarrow$  (2). If  $R$  is a coherent ring, then the previous conditions are equivalent.

*Proof.* (1)  $\Rightarrow$  (2) Let  $\mathcal{F} : \dots \rightarrow F_1 \rightarrow F_0 \rightarrow F^0 \rightarrow F^1 \rightarrow \dots$  be a complete flat resolution, such that  $M \cong \text{Im}(F_0 \rightarrow F^0)$ . Then

$$\mathcal{F}^+ : \dots \rightarrow F^{1+} \rightarrow F^{0+} \rightarrow F_0^+ \rightarrow F_1^+ \rightarrow \dots$$

is an exact sequence of injective  $R$ -modules, such that  $M^+ \cong \text{Im}(F^{0+} \rightarrow F_0^+)$ . On the other hand, we have for all nonnil-injective  $R$ -modules  $E$ ,

$$\text{Hom}_R(E, \mathcal{F}^+) = \text{Hom}_R(E, \text{Hom}_{\mathbb{Z}}(\mathcal{F}, \mathbb{Q}/\mathbb{Z})) \cong \text{Hom}_{\mathbb{Z}}(E \otimes_R \mathcal{F}, \mathbb{Q}/\mathbb{Z})$$

which is exact. Then  $\mathcal{F}^+$  is a complete injective resolution and  $M^+$  is nonnil-Gorenstein injective.

**Suppose now that  $R$  is a coherent ring.**

(2)  $\Rightarrow$  (3) From Remark 2.16 and [21, 3.6. Theorem],  $M$  admits a co-proper right flat resolution  $0 \rightarrow M \rightarrow F^0 \rightarrow F^1 \rightarrow F^2 \rightarrow \dots$ .

Let's prove that  $\text{Tor}_i^R(E, M) = 0$  for all  $i > 0$  and injective  $R$ -module  $E$ . Let  $\dots \rightarrow F_2 \rightarrow F_1 \rightarrow F_0 \rightarrow M \rightarrow 0$  be a flat resolution of  $M$ , then  $0 \rightarrow M^+ \rightarrow F_0^+ \rightarrow F_1^+ \rightarrow F_2^+ \rightarrow \dots$  is an injective resolution. Let  $E$  be an  $R$ -module, we have the following commutative diagram:

$$\begin{array}{ccccccc} \dots & \longrightarrow & \text{Hom}_R(E, F_1^+) & \longrightarrow & \text{Hom}_R(E, F_0^+) & \longrightarrow & \text{Hom}_R(E, M^+) \longrightarrow 0 \\ & & \downarrow & & \downarrow \cong & & \downarrow \cong \\ \dots & \rightarrow & \text{Hom}_{\mathbb{Z}}(E \otimes_R F_1, \mathbb{Q}/\mathbb{Z}) & \rightarrow & \text{Hom}_{\mathbb{Z}}(E \otimes_R F_0, \mathbb{Q}/\mathbb{Z}) & \rightarrow & \text{Hom}_{\mathbb{Z}}(E \otimes_R M, \mathbb{Q}/\mathbb{Z}) \rightarrow 0 \end{array}$$

such that the upper row of the diagram is exact as  $M^+$  is nonnil-Gorenstein injective, then also the lower row is exact, which means that  $\text{Tor}_i^R(E, M) = 0$  for all  $i > 0$  and every nonnil-injective  $R$ -module  $E$ . Now, let  $\mathcal{F}_l : \dots \rightarrow F_1 \rightarrow F_0 \rightarrow M \rightarrow 0$  be a flat resolution of  $M$ . By linking  $\mathcal{F}_l$  with  $\mathcal{F}_r$  through  $M$ , we get the following complete flat resolution of  $M$ :

$$\dots F_1 \rightarrow F_0 \rightarrow F^0 \rightarrow F^1 \rightarrow \dots.$$

So, the following

$$\dots F^{1+} \rightarrow F^{0+} \rightarrow F_0^+ \rightarrow F_1^+ \rightarrow \dots$$

is a complete injective resolution of  $M^+$ . Since,  $M^+$  is assumed nonnil-Gorenstein injective, we get the following exact sequence  $\dots \rightarrow \text{Hom}_R(E, F^{1+}) \rightarrow \text{Hom}_R(E, F^{0+}) \rightarrow \text{Hom}_R(E, M^+) \rightarrow 0$ , that means the sequence  $\dots \rightarrow (E \otimes_R F^0)^+ \rightarrow (E \otimes_R F^0)^+ \rightarrow (E \otimes_R M)^+ \rightarrow 0$  is exact. Hence, we get that  $E \otimes_R \mathcal{F}_r$  is exact, as desired.

(3)  $\Rightarrow$  (1) By the same way as (2)  $\Rightarrow$  (3), we get a complete flat resolution by linking  $\mathcal{F}_l$  with  $\mathcal{F}_r$  through  $M$ . So, the assumption,  $\text{Tor}_i^R(E, M) = 0$  for every nonnil-injective  $R$ -module  $E$  and every  $i > 0$ , implies that the complex  $E \otimes_R \mathcal{F}_l$  is exact. By assumption, the complex  $E \otimes_R \mathcal{F}_r$  is exact. Hence, by linking  $E \otimes_R \mathcal{F}_r$  and  $E \otimes_R \mathcal{F}_l$  through  $E \otimes_R M$ , we showed that  $M$  is a nonnil-Gorenstein flat  $R$ -module. □

**Remark 2.19.** Let  $K$  be a field and consider  $R = K \ltimes K$ . There exists a Gorenstein flat  $R$ -module  $M$  which is not nonnil-Gorenstein flat: in fact, from [27, Corollary 3.8] and [29, Proposition 2.3], every  $R$ -module is a Gorenstein flat. But,  $R$  is not a von Neumann regular ring, which means that, there exists an  $R$ -module  $M$  that not flat. If  $M$  is a nonnil-Gorenstein flat  $R$ -module, then  $Tor_R^k(E, M) = 0$  for every  $R$ -module  $E$  and every  $k > 0$  by Theorem 2.18, [14, Corollary 5.34] and Corollary 2.6. Hence,  $M$  is flat, a contradiction.

**Corollary 2.20.** Let  $R$  be a coherent ring and  $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$  be a short exact sequence of  $R$ -modules. If  $C$  is a nonnil-Gorenstein flat  $R$ -module, then  $A$  is a nonnil-Gorenstein flat  $R$ -module if and only if  $B$  is a nonnil-Gorenstein flat  $R$ -module.

*Proof.* The short exact sequence of  $R$ -modules  $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$  induces the short exact sequence  $0 \rightarrow C^+ \rightarrow B^+ \rightarrow A^+ \rightarrow 0$ . By Theorem 2.18, if  $C$  is a nonnil-Gorenstein flat  $R$ -module then  $C^+$  is a nonnil-Gorenstein injective  $R$ -module. So, from Theorem 2.13,  $A^+$  is a nonnil-Gorenstein injective  $R$ -module if and only if  $B^+$  is a nonnil-Gorenstein injective  $R$ -module. Again Theorem 2.18,  $A$  is a nonnil-Gorenstein flat  $R$ -module if and only if  $B$  is a nonnil-Gorenstein flat  $R$ -module.  $\square$

**Theorem 2.21.** Let  $R$  be a coherent ring and consider the short exact sequence of  $R$ -modules  $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ , where  $A$  and  $B$  are nonnil-Gorenstein flat  $R$ -module. If  $Tor_1^R(E, C) = 0$  for every (nonnil)-injective  $R$ -module  $E$ , then  $C$  is a nonnil-Gorenstein flat  $R$ -module.

*Proof.* The proof follows from [30, 4.6. Proposition] if we consider  $E$  as an injective  $R$ -module. Now, assuming that  $E$  is nonnil-injective. Considering the short exact sequence of  $R$ -modules  $0 \rightarrow C^+ \rightarrow B^+ \rightarrow A^+ \rightarrow 0$ . By Theorem 2.18, both  $A^+$  and  $B^+$  are nonnil-Gorenstein injective  $R$ -modules. By assumption, we get  $Ext_R^1(E, C^+) = 0$  for every nonnil-injective  $R$ -module  $E$ . But for every  $k > 1$ , we get the isomorphism  $Ext_R^k(E, A^+) \cong Ext_R^{k+1}(E, C^+) = 0$ . Therefore,  $C^+$  is a nonnil-Gorenstein injective  $R$ -module. But  $R$  is a coherent ring, and so,  $C$  is a nonnil-Gorenstein flat  $R$ -module.  $\square$

**Proposition 2.22.** If  $R$  is coherent, then the class of nonnil-Gorenstein flat left  $R$ -modules is closed under extensions, kernels of epimorphisms, direct sums and direct summands.

*Proof.* It follows immediately from [30, 4.5. Proposition] by setting  $\mathcal{Y}$  as the set of all nonnil-injective  $R$ -modules.  $\square$

### 3 On nonnil-G-projective, nonnil-G-injective dimensions and nonnil-G-flat dimensions

In this section, we introduce the analogs of the Gorenstein injective dimension and the Gorenstein projective dimension.

**Definition 3.1.** Let  $M$  be an  $R$ -module. Then  $M$  is said to have a finite nonnil-G-projective dimension at most  $n \in \mathbb{N}$  (we denote  $\phi\text{-Gpd}_R M \leq n$ ) if there exists a finite nonnil-G-projective resolution, that is

$$0 \rightarrow P_n \rightarrow P_{n-1} \rightarrow \cdots \rightarrow P_1 \rightarrow P_0 \rightarrow M \rightarrow 0, \quad (3)$$

in which every  $P_i$  is nonnil-G-projective. If  $M$  does not have a finite length of nonnil-G-projective resolution, then we set  $\phi\text{-Gpd}_R M = \infty$ .

Dually, let  $N$  be an  $R$ -module. Then  $N$  is said to have a finite nonnil-G-injective dimension at most  $n \in \mathbb{N}$  if there exists a nonnil-G-injective resolution, that is

$$0 \rightarrow N \rightarrow E_0 \rightarrow E_1 \rightarrow \cdots \rightarrow E_n \rightarrow 0, \quad (4)$$

in which every  $E_j$  is nonnil-G-injective. If  $N$  does not have a finite length of nonnil-G-injective resolution, then we set  $\phi\text{-Gid}_R N = \infty$ .

**Remark 3.2.** Obviously, an  $R$ -module  $M$  is nonnil-G-projective if and only if its nonnil-G-projective dimension is zero. Similarly, an  $R$ -module  $N$  is nonnil-G-injective if and only if its nonnil-G-injective dimension is zero.

Next, the following theorem is an analog of the well-known result [33, Proposition 11.3.4].

**Theorem 3.3.** Let  $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$  be an exact sequence.

1. If  $\phi\text{-Gpd}_R B > \phi\text{-Gpd}_R C$ , then  $\phi\text{-Gpd}_R A = \phi\text{-Gpd}_R B$ .
2. If  $\phi\text{-Gid}_R B > \phi\text{-Gid}_R A$ , then  $\phi\text{-Gid}_R B = \phi\text{-Gid}_R C$ .

*Proof.* We will only prove (1); the case of (2) can be dually proved with (1). Write  $m = \phi\text{-Gpd}_R A$ ,  $n = \phi\text{-Gpd}_R B$ , and  $s = \phi\text{-Gpd}_R C$ . First let  $s = 0$ , that is,  $C$  is a nonnil-G-projective module. If  $m < \infty$ , consider a nonnil-G-projective resolution

$$\mathcal{P} : \dots \rightarrow P_m \rightarrow P_{m-1} \rightarrow \dots \rightarrow P_0 \rightarrow A \rightarrow 0$$

of  $A$ . For  $i > m$ , set  $P_i = 0$ . Since  $C$  is nonnil-G-projective, there is an exact sequence

$$\mathcal{Q} : \dots \rightarrow Q_m \rightarrow Q_{m-1} \rightarrow \dots \rightarrow Q_0 \rightarrow C \rightarrow 0$$

such that each  $Q_i$  is projective and each syzygy  $C_i$  is nonnil-G-projective. So, we can prove that there exists a complex exact sequence  $0 \rightarrow \mathcal{P} \rightarrow \mathcal{F} \rightarrow \mathcal{Q} \rightarrow 0$ , where each term  $F_i = P_i \oplus Q_i$  of  $\mathcal{F}$  is a nonnil-G-projective module. Denote by  $B_i$  the  $i$ -th syzygy of the complex  $\mathcal{F}$ . Then there is an exact sequence  $0 \rightarrow P_m \rightarrow B_m \rightarrow C_m \rightarrow 0$ . By Theorem 2.13(1),  $B_m$  is nonnil-G-projective. Thus  $n \leq m$ . Hence if  $n = \infty$ , then  $m = \infty$ .

Let  $n < \infty$ . Then there is an exact sequence  $0 \rightarrow F_n \rightarrow \dots \rightarrow F_0 \rightarrow B \rightarrow 0$ , where each  $F_i$  is nonnil-G-projective. Let  $K_0$  be the kernel of the homomorphism  $F_0 \rightarrow B$ . Then  $\phi\text{-Gpd}_R K_0 = n - 1$ . Thus we have the following commutative diagram with all exact rows and columns:

$$\begin{array}{ccccccc}
 & & 0 & & 0 & & \\
 & & \downarrow & & \downarrow & & \\
 & & K_0 & \xlongequal{\quad} & K_0 & & \\
 & & \downarrow & & \downarrow & & \\
 0 & \longrightarrow & L & \longrightarrow & F_0 & \longrightarrow & C \longrightarrow 0 \\
 & & \downarrow & & \downarrow & & \parallel \\
 0 & \longrightarrow & A & \longrightarrow & B & \longrightarrow & C \longrightarrow 0 \\
 & & \downarrow & & \downarrow & & \\
 & & 0 & & 0 & & 
 \end{array}$$

By Theorem 2.13 (1),  $L$  is nonnil-G-projective, and so  $m \leq (n - 1) + 1 = n$ . Therefore  $m = n$ . For  $s > 0$  in the general case, we can examine a nonnil-Gorenstein projective resolution of  $A$  and a complete projective resolution of  $C$ . Now the assertion follows by applying the above discussion.  $\square$

**Corollary 3.4.** Let  $M$  be a nonnil-G-projective (resp., nonnil-G-injective) module and  $N$  be an  $R$ -module. Then  $\phi\text{-Gpd}_R(M \oplus N) = \phi\text{-Gpd}_R N$  (resp.,  $\phi\text{-Gid}_R(M \oplus N) = \phi\text{-Gid}_R N$ ).

*Proof.* This follows from the short exact sequence  $0 \rightarrow N \rightarrow M \oplus N \rightarrow M \rightarrow 0$ . If  $M \oplus N$  is nonnil-G-projective, then  $N$  is also nonnil-G-projective by Theorem 2.13(1). If  $\phi\text{-Gpd}_R(M \oplus N) = n > 0$ , then we get  $\phi\text{-Gpd}_R N = n$  by Theorem 3.3. We can prove the "nonnil-G-injective dimension" case dully.  $\square$

**Proposition 3.5.** *Let  $M$  be an  $R$ -module with finite nonnil-Gorenstein injective dimension  $n$ . Then there exist exact sequences*

$$0 \longrightarrow M \longrightarrow I \longrightarrow F \longrightarrow 0$$

*with  $I$  nonnil-Gorenstein injective,  $\text{id}(F) \leq n - 1$ , and*

$$0 \longrightarrow I' \longrightarrow F' \longrightarrow M \longrightarrow 0$$

*with  $I'$  nonnil-Gorenstein injective,  $\text{id}(F') \leq n$ .*

*Proof.* It follows immediately from [30, 2.12. Proposition] by setting  $\mathcal{Y}$  as the set of all nonnil-injective  $R$ -modules.  $\square$

**Corollary 3.6.** *Let  $0 \rightarrow M \rightarrow I_0 \rightarrow I_1 \rightarrow 0$  be a short exact sequence of  $R$ -modules, where  $I_0$  and  $I_1$  are nonnil-Gorenstein injective modules and  $\text{Ext}_R^1(I, M) = 0$  for all injective  $R$ -modules  $I$ . Then  $M$  is nonnil-Gorenstein injective.*

*Proof.* It follows immediately from [30, 2.13. Corollary] by setting  $\mathcal{Y}$  as the set of all nonnil-injective  $R$ -modules.  $\square$

The following theorem is the main ingredient of the important functorial description of the nonnil-G-projective dimension.

**Theorem 3.7.** The following are equivalent for an  $R$ -module  $M$  of finite nonnil-G-projective dimension:

1.  $\phi\text{-Gpd}_R M \leq n$ .
2.  $\text{Ext}_R^k(M, Q) = 0$  for every  $R$ -module  $Q$  with finite  $\phi$ -projective dimension and every  $k > n$ .
3.  $\text{Ext}_R^k(M, Q) = 0$  for every  $\phi$ -u-projective  $R$ -module  $Q$  and every  $k > n$ .
4. If  $0 \rightarrow P_n \rightarrow P_{n-1} \rightarrow \cdots \rightarrow P_0 \rightarrow M \rightarrow 0$  is an exact sequence such that every  $P_i$ , where  $0 \leq i \leq n-1$ , is a projective module, then  $P_n$  is nonnil-G-projective.
5. If  $0 \rightarrow Q_n \rightarrow Q_{n-1} \rightarrow \cdots \rightarrow Q_0 \rightarrow M \rightarrow 0$  is an exact sequence such that every  $Q_i$ , where  $0 \leq i \leq n-1$ , is a nonnil-G-projective module, then  $Q_n$  is nonnil-G-projective.
6.  $\text{Ext}_R^k(M, Q) = 0$  for every  $R$ -module  $Q$  with finite projective dimension and every  $k > n$ .
7.  $\text{Ext}_R^k(M, Q) = 0$  for every projective  $R$ -module  $Q$  and every  $k > n$ .

*Proof.* Set  $m = \phi\text{-Gpd}_R M$ . Then there exists a nonnil-G-projective resolution

$$0 \rightarrow G_m \rightarrow G_{m-1} \rightarrow \cdots \rightarrow G_1 \rightarrow G_0 \rightarrow M \rightarrow 0 \tag{5}$$

such that each  $G_i$  is nonnil-G-projective. We set  $K_i$  to be its  $i$ -th syzygy of (5). In particular,  $K_{-1} := M$ . Note that if  $k > m + 1$ , then  $K_{k-2} \cong G_{k-1}$ .

(5)  $\Rightarrow$  (1) This is straightforward.

(1)  $\Rightarrow$  (2) Let  $k > 0$  and  $i \geq -1$ . Then we have the short exact sequence  $0 \rightarrow K_{i+1} \rightarrow G_i \rightarrow K_i \rightarrow 0$ . By Theorem 2.3, we get  $\text{Ext}_R^k(G_i, Q) = 0$ , and so we have the isomorphism  $\text{Ext}_R^k(K_{i+1}, Q) \cong \text{Ext}_R^{k+1}(K_i, Q)$ . Since  $\phi\text{-Gpd}_R M \leq n$ , it follows that for every  $k > n$ ,  $\text{Ext}_R^k(M, Q) \cong \text{Ext}_R^{k-1}(K_0, Q) \cong \dots \cong \text{Ext}_R^1(K_{k-2}, Q) = \text{Ext}_R^1(G_{k-1}, Q) = 0$ .

(2)  $\Rightarrow$  (3) This is straightforward.

(3)  $\Rightarrow$  (1) If  $m = 0$ , naturally we have  $m \leq n$ . Let  $m > 0$  and set  $L := \text{Ker}(G_0 \rightarrow M)$ . Then  $\phi\text{-Gpd}_R L = m - 1$ . Take a projective module  $P$  and an epimorphism  $P \rightarrow M$ . Set  $K := \text{Ker}(P \rightarrow M)$ . By [33, Theorem 2.3.12], there is an exact sequence  $0 \rightarrow K \rightarrow L \oplus P \rightarrow G_0 \rightarrow 0$ . By Corollary 3.4,  $\phi\text{-Gpd}_R(L \oplus P) = m - 1$ . By Proposition 3.3,  $\phi\text{-Gpd}_R K = m - 1$ . Since  $\text{Ext}_R^{k-1}(K, Q) = \text{Ext}_R^k(M, Q) = 0$  for any  $k > n$  and any  $\phi$ -u-projective module  $Q$ , by induction  $m - 1 \leq n - 1$ . Thus  $m \leq n$ .

(1)  $\Rightarrow$  (4) Assume that  $\phi\text{-Gpd}_R M \leq n$ . Then there exists a nonnil-Gorenstein projective resolution of  $M$  as follows:

$$0 \rightarrow G_n \rightarrow G_{n-1} \rightarrow \dots \rightarrow G_1 \rightarrow G_0 \rightarrow M \rightarrow 0$$

in which every  $G_i$  is nonnil-G-projective. By [33, Theorem 3.2.1], we get the following commutative diagram:

$$\begin{array}{ccccccccccc} 0 & \longrightarrow & P_n & \longrightarrow & P_{n-1} & \longrightarrow & \dots & \longrightarrow & P_0 & \longrightarrow & M & \longrightarrow & 0 \\ & & \downarrow & & \downarrow & & & & \downarrow & & \parallel & & \\ 0 & \longrightarrow & G_n & \longrightarrow & G_{n-1} & \longrightarrow & \dots & \longrightarrow & G_0 & \longrightarrow & M & \longrightarrow & 0 \end{array}$$

By [33, Lemma 11.3.3], there exists an exact sequence  $0 \rightarrow P_n \rightarrow P_{n-1} \oplus G_n \rightarrow \dots \rightarrow P_1 \oplus G_2 \rightarrow P_0 \oplus G_1 \rightarrow G_0 \rightarrow 0$ . Since  $G_0, G_1, \dots, G_n$  are nonnil-Gorenstein projective modules, repeated application of Theorem 2.13 implies that  $P_n$  is also nonnil-G-projective.

(4)  $\Rightarrow$  (5) Let  $0 \rightarrow P_n \rightarrow P_{n-1} \rightarrow \dots \rightarrow P_1 \rightarrow P_0 \rightarrow M \rightarrow 0$  be an exact sequence of  $R$ -modules such that  $P_0, P_1, \dots, P_{n-1}$  are projective modules. Then  $P_n$  is nonnil-G-projective. By [33, Theorem 3.2.1], we get the following commutative diagram:

$$\begin{array}{ccccccccccc} 0 & \longrightarrow & P_n & \longrightarrow & P_{n-1} & \longrightarrow & \dots & \longrightarrow & P_0 & \longrightarrow & M & \longrightarrow & 0 \\ & & \downarrow & & \downarrow & & & & \downarrow & & \parallel & & \\ 0 & \longrightarrow & Q_n & \longrightarrow & Q_{n-1} & \longrightarrow & \dots & \longrightarrow & Q_0 & \longrightarrow & M & \longrightarrow & 0 \end{array}$$

Therefore, by [33, Lemma 11.3.3], there exists an exact sequence  $0 \rightarrow P_n \rightarrow P_{n-1} \oplus Q_n \rightarrow \dots \rightarrow P_1 \oplus Q_2 \rightarrow P_0 \oplus Q_1 \rightarrow Q_0 \rightarrow 0$ . Decompose this exact sequence into two exact sequences

$$0 \rightarrow P_n \rightarrow P_{n-1} \oplus Q_n \rightarrow K \rightarrow 0$$

and

$$0 \rightarrow K \rightarrow P_{n-2} \oplus Q_{n-1} \rightarrow \dots \rightarrow P_0 \oplus Q_1 \rightarrow Q_0 \rightarrow 0.$$

By Theorem 2.13, we deduce that  $K$  is nonnil-G-projective, since all  $Q_i$  are nonnil-G-projective modules. Therefore,  $Q_n$  is nonnil-G-projective, as desired.

(5)  $\Leftrightarrow$  (6)  $\Leftrightarrow$  (7) These follow immediately from [30, 3.14. Proposition] by setting  $\mathcal{X}$  as the set of all  $\phi$ -u-projective  $R$ -modules. □

**Corollary 3.8.** *Let  $M$  be an  $R$ -module with finite nonnil-Gorenstein projective dimension. Then  $\text{Gpd}_R M = \phi\text{-Gpd}_R M$ . In particular, an  $R$ -module  $M$  is Gorenstein projective if and only if  $M$  is nonnil-Gorenstein projective.*

*Proof.* It follows immediately from [30, 3.15. Corollary] by setting  $\mathcal{X}$  as the set of all  $\phi$ -u-projective  $R$ -modules. □

**Remark 3.9.** We define  $\mathcal{P}r(R)$  (resp.,  $\overline{\mathcal{P}r(R)}$ ) for the class of all  $\phi$ -u-projective modules (resp., all  $R$ -modules of finite  $\phi$ -projective dimension). By Theorem 3.7, the nonnil-G-projective dimension of an  $R$ -module  $M$  is given as follows:

$$\begin{aligned}\phi\text{-Gpd}_R M &= \sup\{i \in \mathbb{N} \mid \exists Q \in \mathcal{P}r(R) \text{ such that } \text{Ext}_R^i(M, Q) \neq 0\} \\ &= \sup\{i \in \mathbb{N} \mid \exists Q \in \overline{\mathcal{P}r(R)} \text{ such that } \text{Ext}_R^i(M, Q) \neq 0\}.\end{aligned}$$

Dually with Theorem 3.7, we establish the following theorem.

**Theorem 3.10.** Let  $n \in \mathbb{N}$ . Then the following are equivalent for an  $R$ -module  $N$  of finite nonnil-G-projective dimension:

1.  $\phi\text{-Gid}_R N \leq n$ ,
2.  $\text{Ext}_R^k(Q, N) = 0$  for every  $R$ -module  $Q$  with finite  $\phi$ -injective dimension and every  $k > n$ ,
3.  $\text{Ext}_R^k(Q, N) = 0$  for every nonnil-injective  $R$ -module  $Q$  and every  $k > n$ ,
4. If  $0 \rightarrow N \rightarrow E_0 \rightarrow E_1 \cdots \rightarrow E_n \rightarrow 0$  such that every  $E_i$ , where  $0 \leq i \leq n-1$ , is an injective module, then  $E_n$  is nonnil-G-injective.
5. If  $0 \rightarrow N \rightarrow Q_0 \rightarrow Q_1 \cdots \rightarrow Q_n \rightarrow 0$  such that every  $Q_i$ , where  $0 \leq i \leq n-1$ , is nonnil-G-injective module, then  $Q_n$  is nonnil-G-injective.
6.  $\text{Ext}_R^k(Q, N) = 0$  for every injective  $R$ -module  $Q$  and every  $k > n$ ,
7.  $\text{Ext}_R^k(Q, N) = 0$  for every  $R$ -module  $Q$  with finite injective dimension and every  $k > n$ ,

*Proof.* The proof the first statements is similar of to that of Theorem 3.7.

(5)  $\Leftrightarrow$  (6)  $\Leftrightarrow$  (7) These follow immediately from [30, 2.15. Proposition].  $\square$

**Remark 3.11.** We define  $\mathcal{I}(R)$  (resp.,  $\overline{\mathcal{I}(R)}$ ) for the class of all nonnil-injective modules (resp., all  $R$ -modules of finite  $\phi$ -injective dimension). By Theorem 3.10, the nonnil-G-injective dimension of an  $R$ -module  $N$  is given as follows:

$$\begin{aligned}\phi\text{-Gid}_R M &= \sup\{i \in \mathbb{N} \mid \exists Q \in \mathcal{I}(R) \text{ such that } \text{Ext}_R^i(Q, M) \neq 0\} \\ &= \sup\{i \in \mathbb{N} \mid \exists Q \in \overline{\mathcal{I}(R)} \text{ such that } \text{Ext}_R^i(Q, M) \neq 0\}.\end{aligned}$$

**Corollary 3.12.** Let  $N$  be an  $R$ -module with finite nonnil-Gorenstein injective dimension. Then  $\text{Gid}_R N = \phi\text{-Gid}_R N$ . In particular, an  $R$ -module is nonnil-Gorenstein injective if and only if it is Gorenstein injective.

*Proof.* It follows immediately from [30, 2.16. Corollary] by setting  $\mathcal{I}$  as the class of all nonnil-injective  $R$ -modules.  $\square$

**Corollary 3.13.** Let  $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$  be a short exact sequence of  $R$ -modules and let  $n \in \mathbb{N}$ . Then the following hold.

1. If  $\phi\text{-Gpd}_R B \leq n$  and  $\phi\text{-Gpd}_R C \leq n$ , then  $\phi\text{-Gpd}_R A \leq n$ . In particular, if both  $B$  and  $C$  are nonnil-G-projective, then so is  $A$ .
2. If  $\phi\text{-Gid}_R A \leq n$  and  $\phi\text{-Gid}_R B \leq n$ , then  $\phi\text{-Gid}_R C \leq n$ . In particular, if both  $A$  and  $B$  are nonnil-G-injective, then so is  $C$ .

*Proof.* (1) By Theorem 3.7(4) and [33, Theorem 2.6.6 (Horseshoe Lemma)], we get that  $\phi\text{-Gpd}_R A < \infty$ . So, for every  $k > n$  and every  $\phi$ -u-projective module  $Q$ , we get the exact sequence  $\text{Ext}_R^k(B, Q) \rightarrow \text{Ext}_R^k(A, Q) \rightarrow \text{Ext}_R^{k+1}(C, Q)$ . By Theorem 3.7,  $\text{Ext}_R^k(A, Q) = 0$ , i.e.,  $\phi\text{-Gpd}_R A \leq n$ .

(2) The proof is similar to that of (1). □

**Corollary 3.14.** *Let  $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$  be a short exact sequence of  $R$ -modules. Then:*

1. *If both  $A$  and  $B$  are nonnil- $G$ -projective modules, then  $C$  is projective if and only if  $\text{Ext}_R^1(C, Q) = 0$  for every nonnil- $G$ -projective module  $Q$ .*
2. *If both  $B$  and  $C$  are nonnil- $G$ -injective modules, then  $A$  is injective if and only if  $\text{Ext}_R^1(Q, A) = 0$  for every nonnil- $G$ -injective module  $Q$ .*

*Proof.* (1) By Theorem 2.7,  $\phi\text{-Gpd}_R C \leq 1$ , and so there exists a short exact sequence  $0 \rightarrow M \rightarrow F \rightarrow C \rightarrow 0$ , where  $F$  is projective and  $M$  is nonnil- $G$ -projective. Since  $\text{Ext}_R^1(C, M) = 0$ , it follows that  $0 \rightarrow M \rightarrow F \rightarrow C \rightarrow 0$  is split, and so  $C$  is projective. The converse is straightforward.

(2) This proof is similar to that of (1). □

**Proposition 3.15.** *Let  $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$  be a short exact sequence of  $R$ -modules and let  $n \in \mathbb{N}$ . Then the following hold.*

1. *If  $\phi\text{-Gpd}_R B < \phi\text{-Gpd}_R C$ , then  $\phi\text{-Gpd}_R A = \phi\text{-Gpd}_R C - 1$ . In general, we get  $\phi\text{-Gpd}_R C \leq 1 + \max\{\phi\text{-Gpd}_R A, \phi\text{-Gpd}_R B\}$ .*
2. *If  $\phi\text{-Gid}_R B < \phi\text{-Gid}_R A$ , then  $\phi\text{-Gid}_R C = \phi\text{-Gid}_R A - 1$ . In general, we get  $\phi\text{-Gid}_R A \leq 1 + \max\{\phi\text{-Gid}_R A, \phi\text{-Gid}_R C\}$ .*

*Proof.* It follows immediately from [34, Corollary 3.7]. □

**Proposition 3.16.** *Let  $R$  be a ring and  $n \in \mathbb{N}$ . Then the following properties hold:*

1. *If  $\phi\text{-Gpd}_R M \leq n$  for every  $R$ -module  $M$ , then the injective dimension of any  $\phi$ -u-projective module is at most  $n$ .*
2. *If  $\phi\text{-Gid}_R N \leq n$  for every  $R$ -module  $N$ , then the projective dimension of any nonnil-injective module is at most  $n$ .*

*Proof.* (1) Let  $Q$  be a  $\phi$ -u-projective module and  $M$  be an  $R$ -module. Since  $\phi\text{-Gpd}_R M \leq n$ , there exists an exact sequence

$$0 \rightarrow P_n \rightarrow P_{n-1} \rightarrow \dots \rightarrow P_1 \rightarrow P_0 \rightarrow M \rightarrow 0.$$

where  $P_0, P_1, \dots, P_{n-1}$  are projective modules and  $P_n$  is nonnil- $G$ -projective. Then  $\text{Ext}_R^{n+1}(M, Q) \cong \text{Ext}_R^1(P_n, Q) = 0$ . Therefore,  $\text{id}_R Q \leq 1$ .

(2) This can be proved dually to (1). □

Next, we give an analog of the well-known result [33, Theorem 11.3.14 (Holm) & Theorem 11.3.15 (Christensen-Frankild-Holm)].

**Proposition 3.17.** *Let  $M$  be an  $R$ -module with finite nonnil-Gorenstein projective dimension  $n$ , then there exist exact sequences*

$$0 \longrightarrow H \longrightarrow G \longrightarrow M \longrightarrow 0$$

*with nonnil-Gorenstein projective and  $\text{pd}(H) \leq n - 1$  and*

$$0 \longrightarrow M \longrightarrow H' \longrightarrow G' \longrightarrow 0.$$

*Proof.* It follows immediately from [30, 3.11. Proposition] by setting  $\mathcal{X}$  as the set of all  $\phi$ -u-projective  $R$ -modules.  $\square$

We next define the nonnil-Gorenstein flat dimension of modules as follows.

**Definition 3.18.** Let  $R$  be a ring and  $M$  be an  $R$ -module. Then  $M$  is said to have a  $\phi$ -Gorenstein flat dimension at most  $n \in \mathbb{N}$ , and we write  $\phi\text{-G-f}d_R M \leq n$ , if there exists a resolution of nonnil-Gorenstein flat  $R$ -modules as follows

$$0 \rightarrow F_n \rightarrow F_{n-1} \rightarrow \cdots \rightarrow F_1 \rightarrow F_0 \rightarrow M \rightarrow 0.$$

If no such resolution exists, we set  $\phi\text{-G-f}d_R M = \infty$ .

**Proposition 3.19.** Let  $R$  be a ring and  $M$  be an  $R$ -module. The following hold.

1.  $\phi\text{-G-id}_R M^+ \leq \phi\text{-G-f}d_R M$ .
2. If  $R$  is a coherent ring, then  $\phi\text{-G-id}_R M^+ = \phi\text{-G-f}d_R M$ .

*Proof.* (1) If  $\phi\text{-G-f}d_R M = \infty$ , the inequality holds. Assuming that  $\phi\text{-G-f}d_R M \leq n$ , where  $n \in \mathbb{N}$ . Then, there exists a resolution of Gorenstein flat  $R$ -modules as follows

$$0 \rightarrow F_n \rightarrow F_{n-1} \rightarrow \cdots \rightarrow F_1 \rightarrow F_0 \rightarrow M \rightarrow 0.$$

The above resolution induces

$$0 \rightarrow M^+ \rightarrow F_0^+ \rightarrow \cdots \rightarrow F_1 \rightarrow F_{n-1}^+ \rightarrow F_n^+ \rightarrow 0$$

which is a resolution of nonnil-Gorenstein injective  $R$ -modules. So, it follows that  $\phi\text{-G-id}_R M^+ \leq n$ , as desired.

(2) This is obvious from Theorem 2.18.  $\square$

**Corollary 3.20.** Let  $R$  be coherent and consider the short exact sequence of  $R$ -modules  $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ , where  $B$  is nonnil-Gorenstein flat. If  $C$  is nonnil-Gorenstein flat, then so is  $A$ . If otherwise  $n > 0$ , then:

$$\phi\text{-G-f}d_R A = \phi\text{-G-f}d_R C - 1.$$

*Proof.* Considering the short exact sequence of  $R$ -modules  $0 \rightarrow C^+ \rightarrow B^+ \rightarrow A^+ \rightarrow 0$ , and applying Proposition 3.19 (2) in conjunction with Proposition 3.15.  $\square$

**Corollary 3.21.** Let  $R$  be a coherent ring. If  $(M_\lambda)_{\lambda \in \Lambda}$  is any family of  $R$ -modules, then we have an equality:

$$\phi\text{-G-f}d_R \left( \bigoplus M_\lambda \right) = \sup \{ \phi\text{-G-f}d_R M_\lambda \mid \lambda \in \Lambda \}.$$

*Proof.* This follows immediately from Proposition 3.19 (2).  $\square$

**Corollary 3.22.** Let  $M$  be an  $R$ -module of finite  $\phi$ -Gorenstein flat dimension with  $R$  is coherent, and let  $n$  be an integer. Then the following conditions are equivalent:

1.  $\phi\text{-G-f}d_R \leq n$ ,
2.  $\text{Tor}_i^R(L, M) = 0$  for all  $i > n$ , and all  $R$ -modules  $L$  with finite  $\phi$ -injective dimension.
3.  $\text{Tor}_i^R(E, M) = 0$  for all  $i > n$ , and all nonnil-injective  $R$ -modules  $E$ .

4. for every exact sequence  $0 \rightarrow K_n \rightarrow G_{n-1} \rightarrow \dots \rightarrow G_0 \rightarrow M \rightarrow 0$ , where  $G_0, \dots, G_{n-1}$  are nonnil-Gorenstein flats, then also  $K_n$  is nonnil-Gorenstein flat.
5.  $\text{Tor}_i^R(L, M) = 0$  for all  $i > n$ , and all  $R$ -modules  $L$  with finite injective dimension.
6.  $\text{Tor}_i^R(E, M) = 0$  for all  $i > n$ , and all injective  $R$ -modules  $E$ .

Consequently, the nonnil-Gorenstein flat dimension of  $M$  is determined by the following formulas:

$$\begin{aligned} \phi\text{-Gfd}_R M &= \sup \{ i \in \mathbb{N} \mid \exists L \in \overline{\phi\text{-}\mathcal{I}(R)} : \text{Tor}_i^R(L, M) \neq 0 \}, \\ &= \sup \{ i \in \mathbb{N} \mid \exists E \in \phi\text{-}\mathcal{I}(R) : \text{Tor}_i^R(E, M) \neq 0 \}, \end{aligned}$$

where,  $\phi\text{-}\mathcal{I}(R)$  (resp.,  $\overline{\phi\text{-}\mathcal{I}(R)}$ ) is the set of all nonnil-injective  $R$ -modules (resp., all  $R$ -modules with finite  $\phi$ -injective dimension).

*Proof.* The equivalences of the first four statements follow immediately from Proposition 3.19 (2) and Theorem 3.10.

(4)  $\iff$  (5)  $\iff$  (6) These follow immediately from [30, 4.9. Proposition] by setting  $\mathcal{Y}$  as the set of all nonnil-injective  $R$ -modules. □

## 4 On nonnil-Gorenstein global dimension

In this section, we denote  $\mathcal{M}_R$  (resp.,  $\mathcal{T}_R$ ) for the class of all  $R$ -modules (resp., for all  $\phi$ -u-torsion  $R$ -modules). We start with the following definition of the nonnil-Gorenstein global dimension as follows.

**Definition 4.1.** For a ring  $R$ , define

$$\phi\text{-G-gl. dim}(R) := \sup \{ \phi\text{-Gpd}_R M \mid M \in \mathcal{M}_R \}, \tag{6}$$

which are called the nonnil-Gorenstein global dimension of  $R$ .

Our next goal is to characterize the rings of finite nonnil-Gorenstein global dimension at most  $n \in \mathbb{N}$ .

**Theorem 4.2.** Let  $n \in \mathbb{N}$ . Then the following are equivalent for a ring  $R$  of finite nonnil-Gorenstein global dimension  $R$ :

1.  $\phi\text{-G-gl. dim}(R) \leq n$ .
2. The injective dimension of any  $\phi$ -u-projective module is at most  $n$ .
3. The projective dimension of any nonnil-injective module is at most  $n$ .
4.  $\phi\text{-Gpd}_R M \leq n$  for any finitely generated  $R$ -module  $M$ .
5.  $\phi\text{-Gpd}_R(R/I) \leq n$  for any ideal  $I$  of  $R$ .
6.  $\text{Ext}_R^k(M, N) = 0$  for any module  $M$ , any module  $N$  of finite  $\phi$ -projective dimension, and any  $k > n$ .
7.  $\phi\text{-Gid}_R N \leq n$  for every  $R$ -module  $N$ .

*Proof.* (3)  $\Rightarrow$  (7) Let  $N$  be an  $R$ -module and  $E$  be a nonnil-injective  $R$ -module. Then for every  $k > n$ , we have  $\text{Ext}_R^k(E, N) = 0$ , since  $\text{pd}_R E \leq n$ . Then  $\phi\text{-Gid}_R N \leq n$  by Theorem 3.10.

(7)  $\Rightarrow$  (3) Let  $E$  be a nonnil-injective module and  $N$  be an  $R$ -module. Then  $\text{Ext}_R^{n+1}(E, N) = 0$  by hypothesis and Theorem 3.10. Therefore,  $\text{pd}_R E \leq n$ .

(1)  $\Rightarrow$  (4)  $\Rightarrow$  (5) These are direct.

(5)  $\Rightarrow$  (2) Let  $P$  be a  $\phi$ -u-projective module. Then by Theorem 3.7, we get  $\text{Ext}_R^k(R/I, P) = 0$  for every  $k > n$  and every ideal  $I$  of  $R$ . Therefore,  $\text{id}_R P \leq n$ .

(1)  $\Leftrightarrow$  (6) This follows from Theorem 3.7.

(1)  $\Leftrightarrow$  (2) The necessity follows immediately from Proposition 3.16. We claim the sufficiency. Let  $M$  be an  $R$ -module and  $P$  be a  $\phi$ -u-projective module. Then for all  $k > n$ , we get that  $\text{Ext}_R^k(M, P) = 0$ , since the injective dimension of  $P$  is at most  $n$ . By Theorem 3.7, we deduce that  $\phi\text{-Gpd}_R M \leq n$ .

(1)  $\Leftrightarrow$  (3) This is the dual of the proof of (1)  $\Leftrightarrow$  (2). □

**Proposition 4.3.** *Let  $R$  be a ring. Then*

$$\begin{aligned} \phi\text{-G-gl.dim}(R) &= \sup\{\phi\text{-Gid}_R N \mid N \in \mathcal{M}_R\} \\ &= \sup\{\text{Gid}_R N \mid N \in \mathcal{M}_R\} \\ &= \sup\{\phi\text{-Gp}_R M \mid M \text{ is a finitely generated } R\text{-module}\} \\ &= \sup\{\phi\text{-Gp}_R\left(\frac{R}{I}\right) \mid I \text{ is an ideal of } R\}. \end{aligned}$$

*Proof.* It follows immediately from Theorem 4.2 and [34, Theorem 4.5]. □

**Proposition 4.4.** *Let  $R$  be a ring. Then  $\text{G-gl.dim}(R) \leq \phi\text{-G-gl.dim}(R)$ , with equality if  $\phi\text{-G-gl.dim}(R) < \infty$ .*

*Proof.* This follows immediately from Remark 2.2, Corollary 3.8, [21, 2.20. Theorem], and [33, Definition 11.4.1]. □

Recall that a ring  $R$  is said to be quasi-Frobenius (QF for short) if every projective module is injective.

**Definition 4.5.** A ring  $R$  is said to be strongly quasi-Frobenius (strongly QF for short) if its nonnil-Gorenstein global dimension is zero.

**Remark 4.6.** It is easy to see that every strongly QF ring is QF. The converse is not true by Remark 2.9.

The following theorem is an analog of the well-known result [33, Theorem 4.6.10 (Faith-Walker)].

**Theorem 4.7.** The following are equivalent for a ring  $R$  of finite nonnil-Gorenstein global dimension:

1.  $R$  is strongly QF,
2. Every nonnil-injective module is projective,
3. Every  $\phi$ -u-projective module is injective,
4.  $R$  is QF such that every nonnil-injective module is injective,
5.  $R$  is QF such that every  $\phi$ -u-projective module is projective,
6. Every  $R$ -module is nonnil-G-injective.

*Proof.* (1)  $\Leftrightarrow$  (2)  $\Leftrightarrow$  (3)  $\Leftrightarrow$  (6) These follow immediately from Theorem 4.2.

(2)  $\Leftrightarrow$  (4) This follows immediately from [33, Theorem 4.6.10 (Faith-Walker)].

(3)  $\Rightarrow$  (5) & (5)  $\Rightarrow$  (1) These follow immediately from [33, Theorem 4.6.10 (Faith-Walker)].  $\square$

**Remark 4.8.** Note that a QF ring is not necessarily a strongly QF ring. In fact, for every field  $K$ , it is easy to see that the ring  $R = K \rtimes K$  is a QF ring by [27, Corollary 3.8]. However,  $R$  is never a strongly QF  $\phi$ -ring, since its nilradical is a  $\phi$ -u-projective  $R$ -module but not projective by [33, Proposition 6.7.12].

It is natural to ask: what are the  $\phi$ -rings of nonnil-Gorenstein global dimension 0? The following theorem answers this question.

**Theorem 4.9.** If  $R \in \mathcal{H}$ , then  $R$  is a field if and only if its nonnil-Gorenstein global dimension equals zero.

*Proof.* The necessity is trivial. Now we prove the sufficiency. Let  $R \in \mathcal{H}$  of nonnil-Gorenstein global dimension 0. By Proposition 4.4 and [7, Proposition 2.6],  $R$  is a QF ring. In particular,  $\text{Nil}(R)$  is finitely generated. By [5, Lemma 2.3], either  $R$  is an integral domain or a local Artinian ring with maximal ideal  $\text{Nil}(R) \neq 0$ . But if  $R$  is not an integral domain, then  $R$  is a  $\phi$ -von Neumann regular ring. So every  $R$ -module is projective by Corollary 2.7, i.e.,  $R$  is a semisimple ring, and so  $\text{Nil}(R) = 0$ , a desired contradiction. Therefore  $R$  is an integral domain. Consequently,  $R$  is a field.  $\square$

We can give a second proof of Theorem 4.9 as follows.

**Second proof of Theorem 4.9.** By Theorem 4.7 and [31, Theorem 1.6], we deduce that if  $R$  is a strongly QF  $\phi$ -ring, then  $R$  is a QF integral domain. Therefore,  $R$  must be a field.  $\square$

Also, there is a third proof as follows.

**Third proof of Theorem 4.9.** First, if  $R \in \mathcal{H}$ , then  $R/\text{Nil}(R)$  is a  $\phi$ -u-projective  $R$ -module. In fact, we claim that  $\text{Ext}_R^1(R/\text{Nil}(R), X) = 0$  for any  $\phi$ -u-torsion  $R$ -module  $X$ . Let  $X$  be a  $\phi$ -u-torsion  $R$ -module. We first show that  $\text{Hom}_R(\text{Nil}(R), X) = 0$ . Let  $\gamma \in \text{Hom}_R(\text{Nil}(R), X)$ . Since  $X$  is a  $\phi$ -u-torsion  $R$ -module,  $sX = 0$  for some  $s \in R \setminus \text{Nil}(R)$ . Since  $R \in \mathcal{H}$ , it follows that  $\text{Nil}(R)$  is a  $\phi$ -divisible  $R$ -module, and so  $\text{Nil}(R) = s\text{Nil}(R)$ . Then for every  $n \in \text{Nil}(R)$ , we can write  $n = sn'$  for some  $n' \in \text{Nil}(R)$ , and so  $\gamma(n) = s\gamma(n') \in sX = 0$ . It follows that  $\text{Hom}_R(\text{Nil}(R), X) = 0$ . However, it follows from the short exact sequence  $0 \rightarrow \text{Nil}(R) \rightarrow R \rightarrow R/\text{Nil}(R) \rightarrow 0$  that  $0 = \text{Hom}_R(\text{Nil}(R), X) \rightarrow \text{Ext}_R^1(R/\text{Nil}(R), X) \rightarrow 0$ . Therefore,  $R/\text{Nil}(R)$  is a  $\phi$ -u-projective  $R$ -module.

Now, if the nonnil-Gorenstein global dimension of  $R$  is zero, then by Theorem 4.7,  $R$  is a QF ring such that  $R/\text{Nil}(R)$  is a projective  $R$ -module, and so  $\text{Nil}(R)$  is a projective ideal of  $R$ . It follows that  $\text{Nil}(R) = 0$  by [33, Proposition 6.7.12], and so  $R$  is both an integral domain and a QF-ring, that is a field. The converse is obvious.  $\square$

As shown in Theorem 4.9, the  $\phi$ -rings with nonnil-Gorenstein global dimension 0 are precisely the fields. Therefore, the class of  $\phi$ -rings of nonnil-Gorenstein global dimension 0 is well-established. To extend this class, let us consider the following definition.

**Definition 4.10.** Let  $R$  be a ring. Define its closed nonnil-Gorenstein global dimension, denoted by  $\overline{\phi\text{-G. gl. dim}(R)}$ , as follows:

$$\overline{\phi\text{-G. gl. dim}(R)} := \sup \{ \phi\text{-Gpd}_R M \mid M \in \mathcal{T} \}. \tag{7}$$

**Theorem 4.11.** The following are equivalent for a ring  $R$  of finite closed nonnil-Gorenstein global dimension:

1.  $\overline{\phi\text{-G. gl. dim}(R)} \leq n$ ,
2. The  $\phi$ -injective dimension of any  $\phi$ -u-projective module is at most  $n$ ,
3. The  $\phi$ -projective dimension of nonnil-injective module is at most  $n$ ,
4.  $\phi\text{-Gpd}_R M \leq n$  for any finitely generated  $\phi$ -u-torsion  $R$ -module  $M$ ,
5.  $\phi\text{-Gpd}_R(R/I) \leq n$  for any nonnil ideal  $I$  of  $R$ ,
6.  $\text{Ext}_R^k(M, N) = 0$  for any  $\phi$ -u-torsion module  $M$ , any module  $N$  of finite  $\phi$ -projective dimension, and any  $k > n$ .

*Proof.* (1)  $\Rightarrow$  (4)  $\Rightarrow$  (5) These are straightforward.

(5)  $\Rightarrow$  (2) Let  $P$  be a  $\phi$ -u-projective module. Then by Theorem 3.7, we get  $\text{Ext}_R^k(R/I, P) = 0$  for every  $k > n$  and every nonnil ideal  $I$  of  $R$ . Therefore,  $\phi\text{-id}_R P \leq n$ .

(1)  $\Leftrightarrow$  (6) This follows from Theorem 3.7.

(1)  $\Leftrightarrow$  (2) The necessity follows immediately from Proposition 3.16. We claim the sufficiency. Let  $M$  be a  $\phi$ -u-torsion  $R$ -module and  $P$  be a  $\phi$ -u-projective module. Then for any  $k > n$ , we get  $\text{Ext}_R^k(M, P) = 0$ , since the  $\phi$ -injective dimension of  $P$  is at most  $n$ . By Theorem 3.7, we deduce that  $\phi\text{-Gpd}_R M \leq n$ .

(1)  $\Leftrightarrow$  (3) This can be proved dually with (1)  $\Leftrightarrow$  (2). □

Next, a  $\phi$ -ring  $R$  is said to be nonnil-self-injective if  $R$  is a nonnil injective module over itself. The following theorem characterizes the  $\phi$ -von Neumann regular rings in terms of the closed nonnil-Gorenstein global dimension.

**Theorem 4.12.** The following are equivalent for a strongly  $\phi$ -ring  $R$ :

1.  $R$  is a nonnil self-injective ring,
2.  $\text{Nil}(R)$  and  $R/\text{Nil}(R)$  are nonnil injective  $R$ -modules,
3.  $\text{Nil}(R)$  is a nonnil-injective ideal of  $R$  and  $R/\text{Nil}(R)$  is a self-injective ring,
4.  $R/\text{Nil}(R)$  is a self injective ring,
5.  $R$  is a  $\phi$ -von Neumann regular ring,
6.  $\overline{\phi\text{-G. gl. dim}(R)} = 0$ .

*Proof.* (1)  $\Rightarrow$  (2) Assume that  $R$  is a nonnil self-injective ring. Then  $\text{Nil}(R)$  is a nonnil injective ideal. In fact, it is easy to see that  $R/\text{Nil}(R)$  is a  $\phi$ -torsion-free  $R$ -module, and so for any nonnil ideal  $I$  of  $R$ , we get  $\text{Hom}_R(R/I, R/\text{Nil}(R)) = 0$  by [32, Theorem 2.3]. Using the sequence  $0 \rightarrow \text{Nil}(R) \rightarrow R \rightarrow R/\text{Nil}(R) \rightarrow 0$ , we obtain that  $\text{Ext}_R^1(R/I, \text{Nil}(R)) = 0$  since  $R$  is nonnil self-injective, and so  $\text{Nil}(R)$  is a nonnil-injective ideal. Since  $\text{Ext}_R^1(R/I, R/\text{Nil}(R)) \cong \text{Ext}_R^2(R/I, \text{Nil}(R))$ , it follows that  $\text{Ext}_R^1(R/I, R/\text{Nil}(R)) = 0$ , and so  $R/\text{Nil}(R)$  is a nonnil injective  $R$ -module.

(2)  $\Rightarrow$  (1) If  $\text{Nil}(R)$  and  $R/\text{Nil}(R)$  are nonnil injective  $R$ -modules, then it is straightforward to see that  $R$  is a nonnil self-injective ring.

(2)  $\Leftrightarrow$  (3) This follows from [31, Proposition 1.4].

(3)  $\Rightarrow$  (5) Let  $s \in R \setminus \text{Nil}(R)$ . Since  $R/\text{Nil}(R)$  is a nonnil-injective  $R$ -module, it is a divisible  $R$ -module by [14, Theorem 2.9], and so there exists  $r \in R$  such that  $1 + \text{Nil}(R) = sr + \text{Nil}(R)$ . Hence  $sr \in 1 + \text{Nil}(R) \subset U(R)$ . Therefore,  $R \setminus \text{Nil}(R) \subset U(R)$ . It follows that  $R$  is a local  $\phi$ -ring with maximal ideal  $\text{Nil}(R)$ . Therefore,  $R$  is a  $\phi$ -von Neumann regular ring by [14, Theorem 5.14].

(5)  $\Rightarrow$  (1) This follows from [14, Remarks 4.9 and Theorem 5.32].

(4)  $\Leftrightarrow$  (5) This follows immediately from [32, Theorem 4.1] and the fact that every self-injective integral domain is a field.

(5)  $\Rightarrow$  (6) If  $R$  is a  $\phi$ -von Neumann regular ring, then each  $\phi$ - $u$ -torsion  $R$ -module is equal zero. Then  $\overline{\phi\text{-G. gl. dim}(R)} = 0$ .

(6)  $\Rightarrow$  (1) Assume that  $R$  is a  $\phi$ -ring of the closed nonnil-Gorenstein global dimension 0. By Theorem 4.11, we deduce easily that  $R$  is nonnil-self-injective.  $\square$

By combining Theorem 2.11 and Theorem 4.12, we give the following corollary.

**Corollary 4.13.** *The following are equivalent for a  $\phi$ -ring  $R$ :*

1.  $R$  is a  $\phi$ -von Neumann regular ring,
2.  $R$  is a strongly  $\phi$ -ring such that every  $R$ -module has finite  $\phi$ -projective dimension and every  $\phi$ -torsion module is nonnil- $G$ -projective,
3.  $R$  is a strongly  $\phi$ -ring such that every  $R$ -module has finite  $\phi$ -projective dimension and every  $\phi$ - $u$ -torsion module is nonnil- $G$ -projective,
4.  $R$  is a strongly  $\phi$ -ring such that every  $R$ -module has finite  $\phi$ -injective dimension and every  $\phi$ -torsion module is nonnil- $G$ -injective,
5.  $R$  is a strongly  $\phi$ -ring such that every  $R$ -module has finite  $\phi$ -injective dimension and every  $\phi$ - $u$ -torsion module is nonnil- $G$ -injective,
6.  $R$  is a strongly  $\phi$ -ring such that every  $\phi$ - $u$ -projective module is nonnil-injective,
7.  $R$  is a strongly  $\phi$ -ring such that every nonnil-injective module is  $\phi$ - $u$ -projective,
8.  $R$  is a strongly  $\phi$ -ring of  $\overline{\phi\text{-G. gl. dim}(R)} = 0$ .
